

MERLIN Mobile

Access Merlin Data From Anywhere

Merlin data on your mobile device

Merlin Mobile works seamlessly with Merlin Enterprise so you can view, acknowledge and annotate your data from anywhere, in the field, on route or even on vacation! Merlin Mobile can be used with most mobile devices to view tabular and graphical data in real time!

View events in real time

Merlin Mobile delivers powerful graphics and tabular data to your mobile device in real time so you can evaluate trends as they occur with just a few clicks. Merlin Mobile shows tabular data in colors to represent current alarm conditions, and time series plots are generated each time new data is collected.

Acknowledge Alarms

You also have the ability to acknowledge alarms simply by clicking on them. When this is recorded in your database, the alarm color reverts to green so other users can see your acknowledgement in real time.

Enter Field Observations

Enter field observations right from your handset to be stored in your monitoring database and displayed on reports and graphs generated by Merlin Web.

Annotate any field event (storm damage, debris blocking a grate) or an instrument calibration or malfunction. The event will be recorded in your database and displayed on time series plots for that instrument keeping your co-workers and customers up-to-date.

Field events that are entered using Merlin Mobile will appear in a Merlin Chart back at the office.

Merlin Mobile is only available as a subscription service (existing grabdata.com subscribers can add this service for a nominal fee), or for customers with Merlin Enterprise.
